Generalized Network Design Problems Generalized Network Design Problems:

Generalized Network Design Problems Petrica C. Pop,2012-10-30 Combinatorial optimization is a fascinating topic Combinatorial optimization problems arise in a wide variety of important fields such as transportation telecommunications computer networking location planning distribution problems etc Important and significant results have been obtained on the theory algorithms and applications over the last few decades In combinatorial optimization many network design problems can be generalized in a natural way by considering a related problem on a clustered graph where the original problem s feasibility constraints are expressed in terms of the clusters i e node sets instead of individual nodes This class of problems is usually referred to as generalized network design problems GNDPs or generalized combinatorial optimization problems The express purpose of this monograph is to describe a series of mathematical models methods propositions algorithms developed in the last years on generalized network design problems in a unified manner The book consists of seven chapters where in addition to an introductory chapter the following generalized network design problems are formulated and examined the generalized minimum spanning tree problem the generalized traveling salesman problem the railway traveling salesman problem the generalized vehicle routing problem the generalized fixed charge network design problem and the generalized minimum vertex biconnected network problem The book will be useful for researchers practitioners and graduate students in operations research optimization applied mathematics and computer science Due to the substantial practical importance of some presented problems researchers in other areas will find this book useful too

Generalized Network Design Problems Corinne Feremans,2002 Network design problems consist of identifying an optimal sub graph of a graph subject to side constraints In generalized network design problems the vertex set is partitioned into clusters and the feasibility conditions are expressed in terms of the clusters Several applications of generalized network design problems arise in the fields of telecommunications transportation and biology The aim of this review paper is to formally define generalized network design problems to study their properties and to provide some applications The generalized problems studied are the minimum spanning tree problem the travelling salesman problem the minimum perfect matching problem the minimum two edge connected spanning network the minimum clique problem the Steiner tree problem and the shortest path problem

Hybrid Metaheuristics for Generalized Network Design Problems Bin Hu,2012 In this book we consider several generalized network design problems which belong to the family of NP hard combinatorial optimization problems In contrast to their classical counterparts the generalized versions are defined on graphs whose node sets are partitioned into clusters The goal is to find a subgraph which spans exactly one node from each cluster and also meets further constraints respectively Applicable methodologies for solving combinatorial optimization problems can roughly be divided into two mainstreams The first class consists of algorithms which aim to solve these

problems to proven optimality provided that they are given enough run time and memory The second class are metaheuristics which compute approximate solutions but usually require significantly less run time By combining these two classes we are able to form collaboration algorithms that benefit from advantages of both sides Such approaches are considered for solving the generalized network design problems in this book **Encyclopedia of Optimization**

Christodoulos A. Floudas, Panos M. Pardalos, 2008-09-04 The goal of the Encyclopedia of Optimization is to introduce the reader to a complete set of topics that show the spectrum of research the richness of ideas and the breadth of applications that has come from this field The second edition builds on the success of the former edition with more than 150 completely new entries designed to ensure that the reference addresses recent areas where optimization theories and techniques have advanced Particularly heavy attention resulted in health science and transportation with entries such as Algorithms for Genomics Optimization and Radiotherapy Treatment Design and Crew Scheduling Hybrid Artificial Intelligence Systems

Design and Implementation of Data Structures for Generalized Networks Agha Iqbal Ali, Abraham Charnes, Tiantai Song, TEXAS UNIV AT AUSTIN CENTER FOR CYBERNETIC STUDIES., University of Texas at Austin. Center for Cybernetic Studies, 1984 The specialization of the simplex algorithm for the solution of generalized network flow problems rests on the fact that a basis for the problem may be represented graphically as a spanning forest in which each component is either a one tree or a rooted tree The design of a specialized algorithm for efficient solution of generalized network problems necessarily depends on data structures chosen to represent the basis This paper presents the design and detailed algorithmic specification of the primal simplex algorithm for such problems Computational testing to determine the overhead required by generalized network data structures over pure network data structures indicates that generalized network algorithms are on the order of 2.5 to 3.5 times slower than pure network algorithms Computational testing with generalized network problems with up to 1000 nodes and 7000 arcs establishes the suitability of the data structures for efficient implementation of primal simplex calculations Keywords Linear programming Author *BICS 2008* Calin Enachescu, Barna Laszlo Iantovics, F. G. Filip, 2009-05-26 This book contains selected papers presented at the International Conference Bio Inspired Computational Methods Used for Difficult Problems Solving Development of Intelligent and Complex Systems BICS 2008 organized by the Romanian Academy Bucharest and Petru Major University of Tg Mures held on 5-7 November 2008 at Petru Major University of Tg Mures Romania The aim of this conference was to bring together researchers working in the main areas of Complex Systems Artificial Intelligence Intelligent Systems and Natural Computing for presenting their recent results and exchanging ideas The papers included in the book provide an introduction and also a state of the art to the bio inspired computer science The areas covered were those of natural computing such as evolutionary and neural computing as well as younger research directions such as DNA computing ant colony optimization with connections and applications to intelligent complex systems and to medical informatics Thus both directions of research from biology to informatics and from informatics to biology are illustrated
