

ENERGY FLOW IN ECOSYSTEMS

Energy Flow

Read the passage carefully before answer.

Producers rely on the flow of energy to sustain themselves in the food web, which provides the energy and other products. When producers are not available, this energy then passes through the food web to the animals and plants, which are also dependent on the flow of energy to sustain themselves.

Photosynthesis is the process by which autotrophic plants, algae, and some bacteria use light energy to produce glucose and oxygen. This process is essential for the survival of all organisms, as it provides the energy and oxygen needed for cellular respiration. The rate of photosynthesis is affected by several factors, including light intensity, carbon dioxide concentration, and temperature.

Consumers use plants and animals as their primary source of energy. They obtain energy from the food they eat. The energy they obtain is used for various purposes, such as growth, reproduction, and movement. The amount of energy that is available to consumers is determined by the amount of energy that is available to the producers.
