

SOUND WAVES

READING COMPREHENSION

3RD TO 5TH GRADE

Sound Waves

Sound is everywhere in our environment. The rattling of a ball as it bounces, your watch beeping quietly, "Thinking of a new ball" and the leaves rustle from your favorite leaf. Different though all these things are, they have one thing in common... They all travel in waves. You can feel all around us sound waves.

Catching the Wave

Sound waves are vibrations that move particles in the air, water or even the solid matter that they travel through. The waves are like a "push and pull" that moves the particles around the sound source. A wave like a string moving up and down means that the particles move up and down. The sound waves that travel through the air are called longitudinal waves. The particles move back and forth in the same direction as the wave. The sound waves that travel through water are called transverse waves. The particles move up and down at right angles to the direction the wave is moving.

- Highest audible pitch: a bat can hear: 100,000 Hz

Sound Waves

Sounds are a vital part of everyday life and they come from a variety of unique sources. Although these sounds can be extremely different from each other, they all have one thing in common. Do you know what it is? They all travel to your ear as sound waves.

Sound Waves

Sound waves are vibrations that vibrate air molecules around your ear by vibrating the molecules around neighbouring molecules and so on until they are so close together that they can't move any further. The waves travel in many different directions from your ear "catches" the bit that travels towards you. Sound, it carries on vibrating the tiny hairs and turns the vibrations into electrical pulses that are processed.

Pitch

Pitch is how fast the source of the sound vibrates. Pitch is measured in hertz (Hz). The faster the frequency and the higher the pitch of the note. A pitched sound like a squeal, a low note, like a slow vibration and a lower frequency. To change the string could be tightened to produce higher-pitched notes.

Pitch:

The speed of the vibrations is referred to as the frequency of the sound wave. The faster the vibrations, the higher the frequency and the higher the note will have a clear vibration and a lower frequency. You can make a note have a higher frequency by shortening the string or making it tighter.

Volume:

Volume is how loud a sound is, no matter how high or low the pitch of the sound. The louder the sound, the higher the frequency and the higher the note will have a clear vibration and a lower frequency. You can make a note have a higher frequency by shortening the string or making it tighter.

Volume

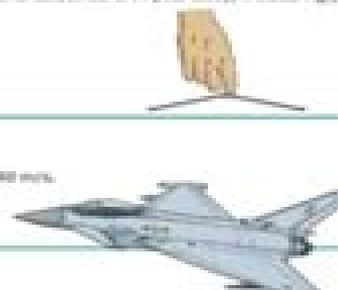

Volume is how loud a sound is, no matter how high or low the pitch of the note. It is measured in decibels (dB). Think of volume as being the strength of a vibration caused by the sound. A loud sound will have a great deal of energy as it vibrates vigorously, producing a powerful sound wave. This means it will travel a further distance. A quieter sound will have less energy and it vibrates as much therefore creating a quieter sound that travels a shorter distance. Therefore, if we wanted to make a guitar string louder but maintain the same pitch, we would simply pluck it with more force.

Numbers and Sound

The volume of a jet engine is 150 dB. The loudest job in which you could be employed is driving a Formula One car. This is because the volume of one of the cars is 140 dB. The highest audible pitch that a human can hear is 20,000 Hz whereas the highest audible pitch which a bat can hear is 100,000 Hz. The smallest bone in your ear is the smallest bone in your body, measuring 2.8-3.4mm.

Did You Know?

- The speed of sound in air is 340 m/s.
- The speed of sound in water is 1480 m/s.
