

Environmental Science

Unit 1 Introduction

Main Concept: *Environmental science is the study of how living things interact with the non-living environment. An understanding of environmental science can help you become a more informed citizen and make choices that are in the best interest of our planet.*

Environmental science is the study of how living things interact with their environment. Students of environmental science need to have a strong understanding of biology, but also some understanding of chemistry, physics, and economics.

We will spend time learning about the planet – air, soil, rock, and water. Then, we will learn about ecosystems and population biology. Next, we turn to humans – our growing population and how we are using and misusing the planet's resources. After you have learned all of this, you will be educated enough to make responsible decisions about our planet in your own life and will, hope fully, understand many of the complicated issues surrounding environmental science.

Overview of Earth Systems

Main Concept: *Environmental science is an interdisciplinary subject that will require broad knowledge of all of Earth's systems.*

To truly understand how the earth works and how best to utilize our resources, we must look at the entire planet and how the various aspects of the planet interact with one another. This is called a holistic approach. In our study of environmental science, we will study the atmosphere, the lithosphere (the surface of the planet), water, species in teracons, and biotic and abiotic factors. All of these are integral to our study of environmental science. We will also study some chemistry (matter, molecules) and physics (thermodynamics).

We will also discuss ecosystems in great detail. Ecosystems provide many services, such as soil,air purification, water purification, nutrient cycling, and pollination, to name a few. We will discuss how these services are very important for humans and what would happen if ecosystems stopped providing these services.

Feedback Loops

Feedback loops play an important role in environmental science and can be classified as either positive or negative.

A **negative feedback loop** is when a change brings about a change in the opposite direction. This causes a system to return to its previous condition. Most natural systems are negative feedback loops.

Here are some examples of negative feedback loops:

- When you get an infection, your body temperature rises (fever). This increased body temperature helps your body fight the infection. When your body has successfully fought the infecon, your body temperature goes back to normal.
- Homeostasis is a condition in the body that maintains your body's internal balance (cells, metabolism).
