Introduction

The procedures in this document describe the configuration steps required to configure the INFINIDAT InfiniBox for use with EMC VPLEX, a virtual storage technology that connects to multiple storage arrays, allowing for data migration and mirroring across sites.

Zeroing the volumes metadata

The metadata and logging volumes must be zeroed before they can be used. Use a utility (like `dd`) to write zeros across the volume.

This will erase all of the data from the volume.

Example:

```
dd if=/dev/zero of=/dev/sdbg conv=notrunc
```

METADATA VOLUMES

Metadata volumes are critical to the proper function of the VPLEX system. VPLEX Meta Data Volumes, or Meta Volumes, contain information about devices, physical-to-virtual device mappings and other internal system configuration data. The importance of the information on these volumes justifies a high level of Meta Volume data redundancy. Meta Volumes are provisioned as RAID 1 along with a minimum of two additional point-in-time copies (one 24 hours old, the other 48 hours old). It is highly recommended that Meta Volumes RAID 1 members be stored on two physically separate storage arrays, using array-provided RAID protection for each member.

LOGGING VOLUMES

A logging volume is dedicated capacity for tracking any blocks written to a cluster. A logging volume is a required prerequisite to creating a distributed device and a remote device. Logging volumes keep track of any blocks written during inter-cluster link failure. The system uses the information in logging volumes to synchronize the distributed devices by sending only changed block regions across the link.

USER DATA VOLUMES

VPLEX virtualizes physical storage array devices and applies three layers of logical abstraction to the storage volumes. VPLEX uses extents to divide storage volumes and applies various RAID geometries (i.e. RAID-0, RAID-1, or RAID-c) to them within in the
